Scenario Name: Prompt 1

Weak Prompt: "Test the search feature."

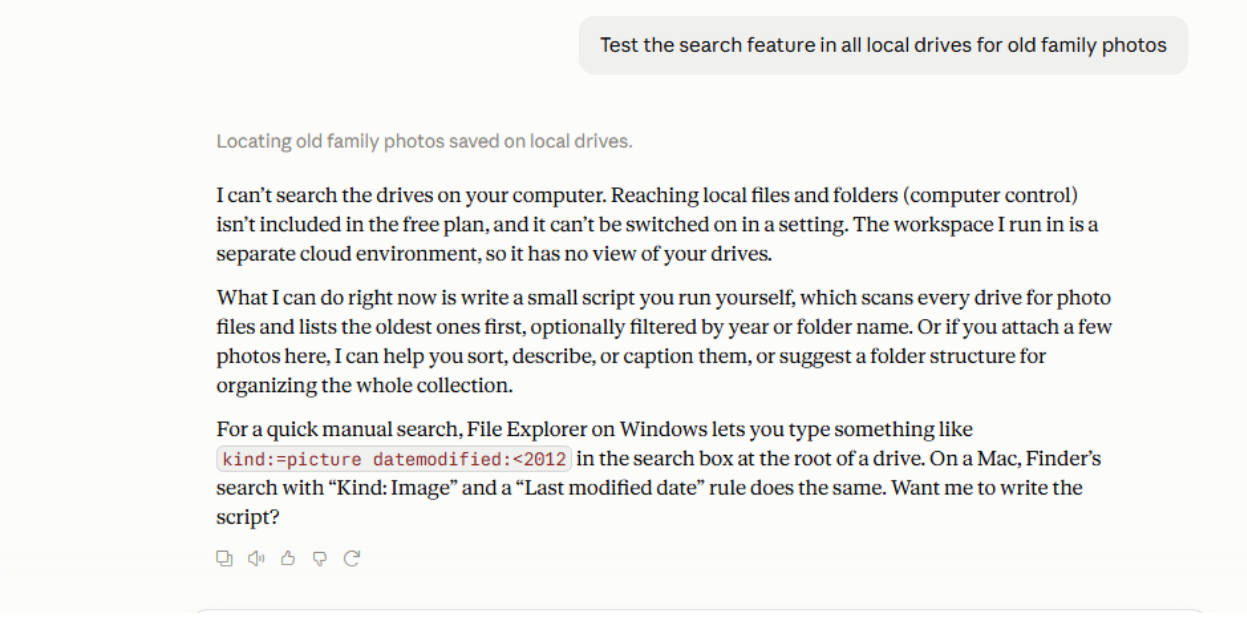

What I feel is missing: What needs to be searched. It needs be searched on web or within local file system

Prompt response:

Rewritten prompt: Test the search feature in all local drives for old family photos

Rewritten prompt response:

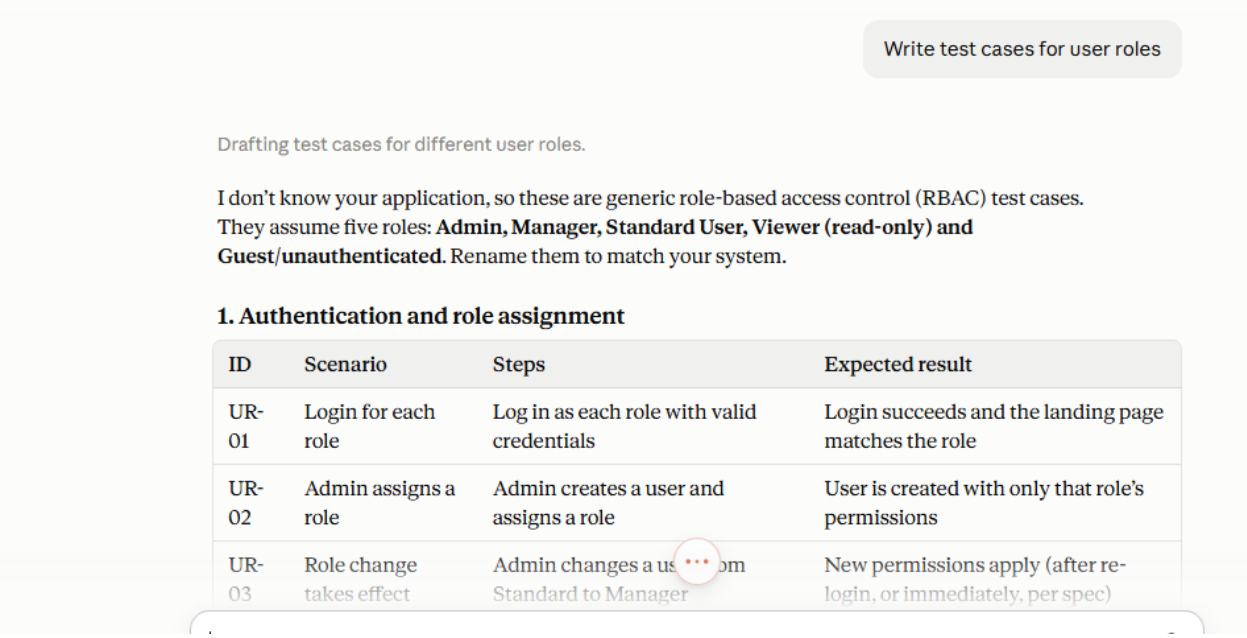

Observations: **First search gave output based on assumption. It gave junk output. It asked the user for specific topic to search for. In rewritten prompt, it could not do the action but gave a query which can be helpful**

Scenario Name: Prompt 2

Weak Prompt: "Write test cases for user roles."

What I feel is missing: Context is missing. What roles exist in system is not mentioned. Test case count or types to be considered is not mentioned. Output format is not mentioned.

Prompt response:

22		Standard User token	
UR-23	Parameter tampering	Change the record ID or role in the request	Request rejected and server-side validation holds
UR-24	Session expiry	Leave the session idle past the timeout	Re-login required, and permissions are re-evaluated
UR-25	Back button after logout	Log out, then press Back	Protected pages are not accessible
UR-26	Audit trail	Perform sensitive actions as different roles	Audit log records the user, role, action and timestamp

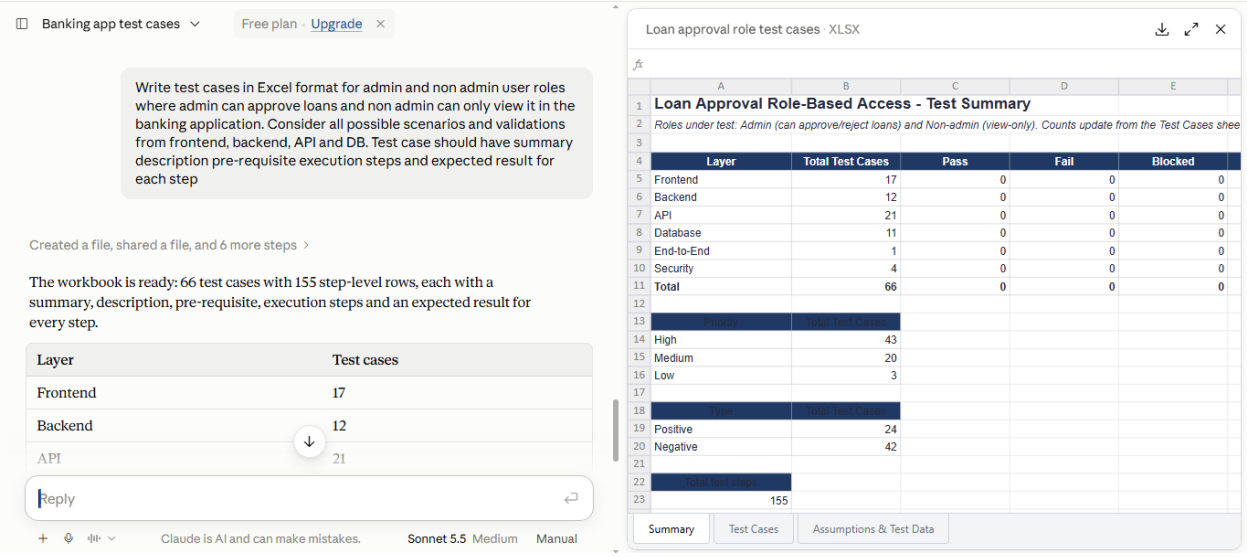

Priority suggestion: UR-21, 22, 23 and 15 are high severity because they check server-side enforcement, not just UI hiding.

If you tell me the application and its roles (for example a banking or insurance workflow), I can tailor these and add test data and role-by-function permission matrix coverage. I can also deliver them as an Excel sheet ready to import into Jira, Zephyr or your test management tool.

Create a spreadsheet

Rewritten prompt: Write test cases in Excel format for admin and non admin user roles where admin can approve loans and non admin can only view it in the banking application. Consider all possible scenarios and validations from frontend, backend, API and DB. Test case should have summary description pre-requisite execution steps and expected result for each step

Rewritten prompt response:

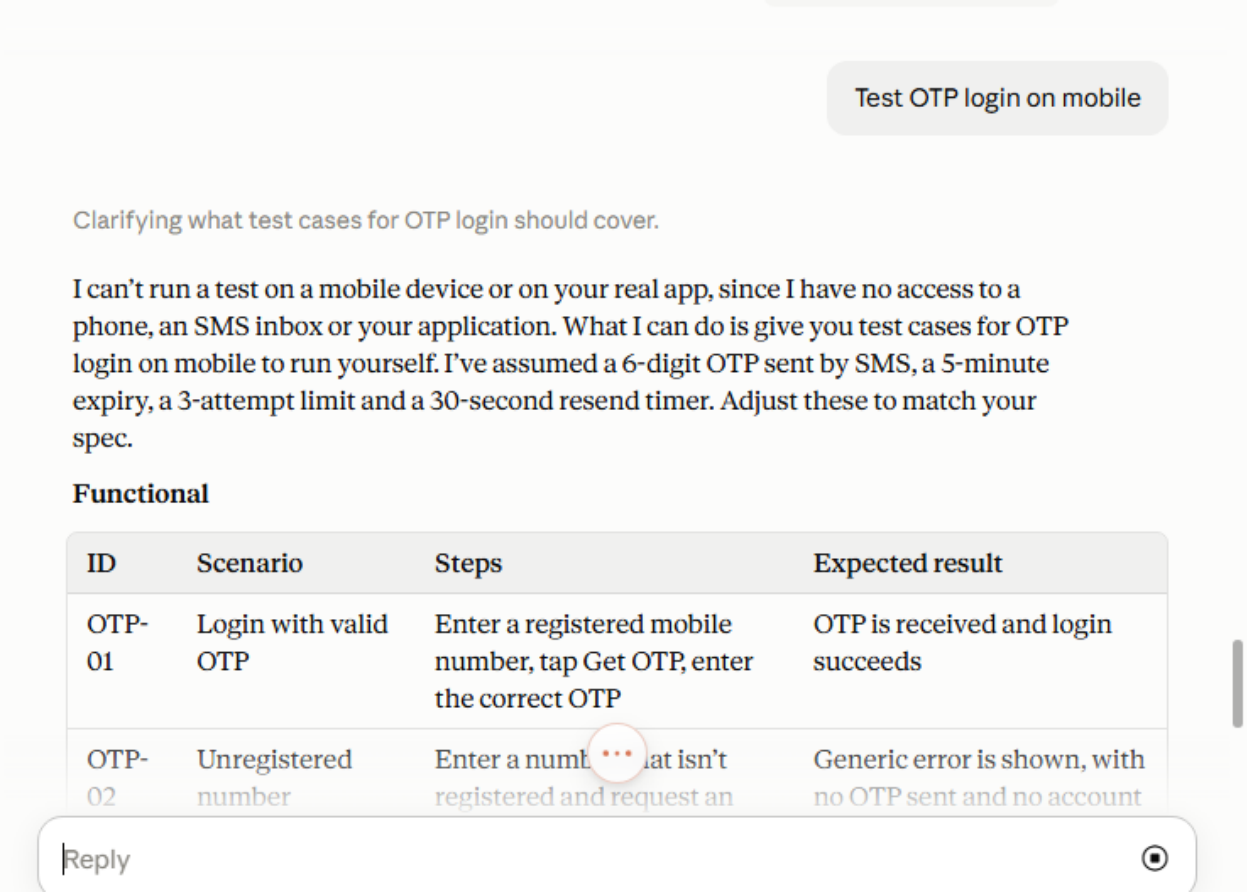

Observations: **Generic role-based test cases were created assuming it's a Web application. User roles were assumed for test case creation. Model asked follow up questions at the end of response to refine the test cases. For rewritten prompt, excel got created with main page, test cases page with all steps and assumptions page to refer before starting execution**

Scenario Name: Prompt 3

Weak Prompt: "Test OTP login on mobile."

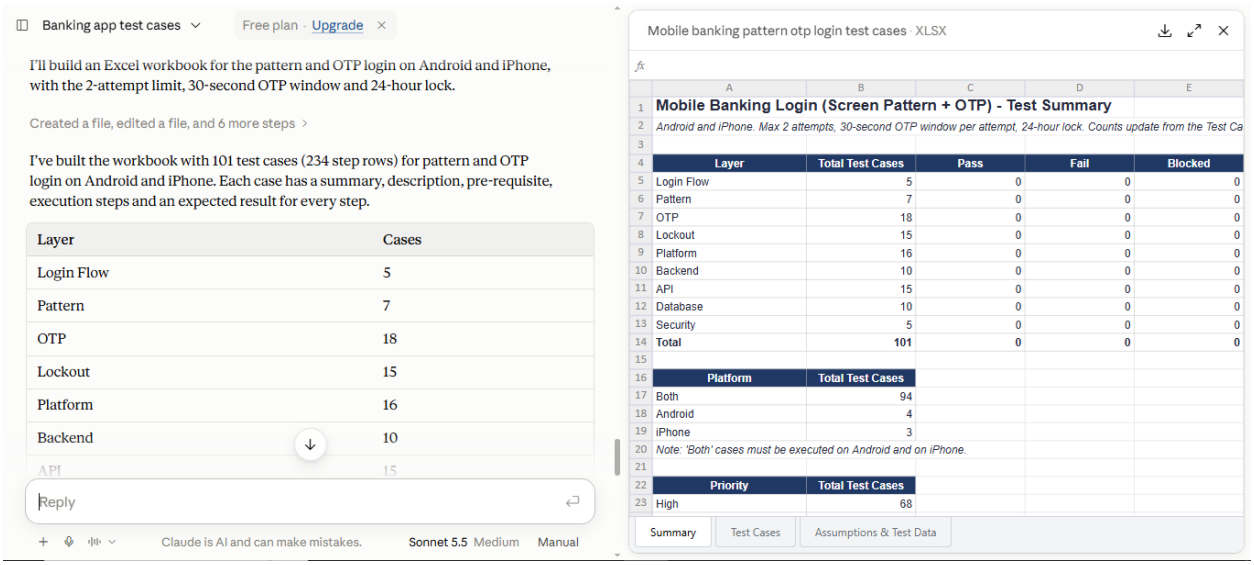

What I feel is missing: Mobile type and application details are missing. User types (persona) are not mentioned. Output format is missing

Prompt response:

Rewritten prompt: Create test cases for mobile banking app login with screen pattern and otp for valid mobile user. Mobile could be both Android and Iphone. Have maximum two attempts and if unsuccessful or OTP not inputted within 30 seconds for each attempt give message to user that their app is locked and they can try after 24 hours

Rewritten prompt response:

Observations: **Model suggested gaps in prompt and created test cases based on assumptions and mentioned the points of assumption as well. It took reference of earlier prompt for output format**
